Echoes of Economic Downturn: Investigating the Persistent Impact of the Great Recession on Birth Rates Among Young Americans*

Yuanyi (Leo) Liu   Qi Er (Emma) Teng

February 13, 2024

In this study, we explore the impact of the Great Recession on birth rates among young people in the United States, utilizing a comprehensive analysis of demographic and economic data. Our findings reveal a significant decline in birth rates within this group during and following the economic downturn, highlighting the intricate relationship between economic stability and reproductive decisions. This research contributes to our understanding of how macroeconomic factors can have profound effects on personal life choices, emphasizing the need for supportive policies targeting young individuals during economic crises.

1

1 Introduction

The Great Recession, a defining economic event of the early 21st century, has been subject to extensive analysis for its profound effects on employment, housing, and financial systems globally. However, its impact on demographic trends, particularly birth rates among young people in the United States, has not been thoroughly explored. This paper aims to fill this gap by examining how the economic downturn influenced reproductive decisions among this demographic.

Utilizing a blend of quantitative data analysis and demographic research, we investigated birth rate trends among young adults during and following the recessionary period. Our methodology involved analyzing birth rate data in conjunction with economic indicators such as unemployment rates, income levels, and housing market trends to draw correlations and insights.

Our findings reveal a significant decline in birth rates among young Americans during the recession, with lingering effects in the subsequent years. This trend suggests that economic instability has a profound impact on personal life choices, including the decision to have children. The implications of these findings are far-reaching, affecting not only demographic forecasting but also social policy and economic recovery strategies.

The paper is structured to facilitate a comprehensive understanding of the study and its implications. Following Section 1, Section 2 presents the data, detailing the data sources, analytical techniques, and the rationale behind the chosen methods. Section 3 discusses the results, elaborating on the observed trends and patterns in brth rate data. Section 4 provides an in-depth discussion of these findings, exploring potential factors influencing these trends, drawing connections to broader socio-economic issues, and providing suggestions for future research in this area.

2 Data

This section aims to offer an insightful understanding of the dataset utilized in our analysis. The dataset captures the birth rates across various demographics in the United States from 1980 to 2020. The data provide a broader context, allowing an analysis of trends over time and across different economic cycles, including the period of the Great Recession.

2.1 Source

// TODO: Add explanation for source

While there were alternative datasets available from other public and private sources, this dataset was chosen due to its comprehensive coverage, reliability, and the level of detail it offers. It includes data from the National Center for Health Statistics (NCHS) and the U.S. Census Bureau, which are both reputable sources of demographic data.

2.2 Methodology

The data was processed and cleaned using R(R Core Team 2020), a powerful statistical programming language. Moreover, most of the data in our dataset are previously cleaned in the project we are replicating. Thus, figure 1 directly used data from `outputs/data/fig_1.csv` without any further cleaning necessary as it simply displays the birth rate from 1980 to 2020. Thus, the cleaned data is directly stored to `outputs/data/fig_1.csv` from `inputs/data/fig_1.csv`.

In figure 2, the dataset was imported from `inputs/data/fig_2.csv` and used `dpylr`(Wickham et al. 2023) to select the birth rate of the 6 age groups (from 15 to 44). Furthermore, the selected data was renamed using `tidyverse`(Wickham et al. 2019) and changed into names that represent the content of the data better. Moreover, these data is then pivoted using `tidyverse`(Wickham et al. 2019) in order to be graphed properly using `ggplot2`(Wickham 2016).

In figure 3, the first dataset was imported from `inputs/data/fig_3a.csv` and the dataset containing American states information was from `mapdata`. The first dataset was first sliced to remove birth rate information regarding the states of Alaska and Hawaii as these two states can't be properly showned in the dataset from `mapdata`. Then, a temporary data frame is created with tibble from `tidyverse`(Wickham et al. 2019) with the abbreviated state names from `inputs/data/fig_3a.csv` and the state full names. Moreover, the abbreviated state name in the first dataset is switched with the state full names using left_join from `dpylr`(Wickham et al. 2023), which is then selected and renamed using `tidyverse`(Wickham et al. 2019). After this, the adjusted dataset with the state full names and birth rate is merged

with the second dataset that contains the American states information for further graphing with `haven`(Wickham, Miller, and Smith 2023).

// TODO: kable

In all three figures, the library `here` were used to ensure file path is accessible in all directories.

2.3 Variables

To better understand the data, the summary_table dataset was developed to offer a more structured and aggregated view of the birth rate data. By transforming and summarizing the data into a format that displays birth rate against years, this dataset simplifies the task of identifying and analyzing trends over time.

Table 1: Birth rate of all groups from 1980 to 1989

Year	15 to 19	20 to 24	25 to 29	30 to 34	35 to 39	40 to 44	white	black	hispanic
1980	53.0	115.1	112.9	61.9	19.8	3.9	NA	NA	NA
1981	52.2	112.2	111.5	61.4	20.0	3.8	NA	NA	NA
1982	52.4	111.6	111.0	64.1	21.2	3.9	NA	NA	NA
1983	51.4	107.8	108.5	64.9	22.0	3.9	NA	NA	NA
1984	50.6	106.8	108.7	67.0	22.9	3.9	NA	NA	NA
1985	51.0	108.3	111.0	69.1	24.0	4.0	NA	NA	NA
1986	50.2	107.4	109.8	70.1	24.4	4.1	NA	NA	NA
1987	50.6	107.9	111.6	72.1	26.3	4.4	NA	NA	NA
1988	53.0	110.2	114.4	74.8	28.1	4.8	NA	NA	NA
1989	57.3	113.8	117.6	77.4	29.9	5.2	60.5	84.8	104.9

This table presents the birth rates for various age groups and racial categories in the United States from the year 1980 to 1989. Moreover, the birth rates are typically expressed per every 1,000 women in the population.To further understand this table, Year represent the years from the selected year range. The next six columns are different age groups for women, which are 15 to 19 years, 20 to 24 years, 25 to 29 years, 30 to 34 years, 35 to 39 years, and 40 to 44 years. Moreover, the last three columns are ethnic groups that describes the birth rates among the white, black, and Hispanic populations. However, some data for these groups are not available except 1989.

// Visualization of the data for intuition

Figure 1, reflecting the trend in birth rates in America over time, captures a significant decline in birth rates commencing around the onset of the Great Recession in 2007-2008. According to Kearney et al. (2022), the economic stress associated with the Great Recession contributed

**Birth Rate in America overtime**

Figure 1: Trends in Birth Rate in US

to a marked downturn in birth rates, with a 7.2 percent drop from 68.1 to 63.2 births per 1,000 women observed between 2008 and 2011. This visual representation is particularly striking as it indicates a sharp and sustained decrease in birth rates coinciding with and following the Great Recession, without a subsequent recovery to pre-recession levels.

2.4 Measurements

// TODO: Add a summary table to show measurements

3 Results

In this section, we delve into the core findings of our study, shedding light on the intricate patterns and trends of birth rate in US.
Birth Rate by Age Group Over Time

Figure 2: Trends in Birth Rate Among Young People in US

Figure 2 displays the birth rates segmented by age groups in the US from 1980 to 2020. Each line represents a different age bracket, showing distinct trends over time. The age groups range from 15-19 up to 40-44 years old. It is evident that the younger age groups experienced a decline in birth rates after 2007, the year marked as the beginning of the Great Recession. Notably, the youngest age group, 15-19, had a significant decrease from rates that were once the highest among the groups. In contrast, the 40-44 age group maintained the lowest birth rates throughout and saw a steafy slow increase.

// TODO: Transit to following figure

Figure 3 portrays the change in birth rates by state across the United States over the period from 2004–2008 to 2015–2019, avoiding the immediate effects of the Great Recession by focusing on the periods before and after its main impact. The map's color gradient, which darkens with more significant decreases in birth rates, shows substantial variation across states. While the decline is widespread, some states, notably in the South, West, and in certain Southwestern and Mountain states, exhibit more significant decreases.
